Mutual Fund Discovery — Platform Comparison

Zerodha Coin vs Angel One | Shivarjun Reddy Palla | March 2026

Primary research: 21-person investor survey + 14,221 mutual funds analyzed

Why This Analysis

A 21-person survey of my friends and family showed 76% of them make fund decisions without tracking any risk metrics. Zerodha and Angel One were the two most-used platforms (6 respondents each). Both display ICICI Prudential Large Cap Fund — yet neither shows Sharpe Ratio, volatility, or max drawdown. This analysis documents that gap.

Angel One — Other Info & Tax

Key Findings

What both platforms get right

- Expense ratio and exit load visible — cost transparency good on both
- Multiple chart time ranges — historical context accessible
- Min SIP amount shown (Rs 100) — entry barrier clear

What Angel One does better

- Risk meter present — Zerodha shows no risk indicator at all
- Sector allocation, fund manager, AUM and tax on one screen
- 86K+ investor count — social proof reduces decision anxiety

What Zerodha does better

- Cleaner visual hierarchy — dark theme reduces cognitive load
- Less cluttered — key metrics easier to read at a glance

Gap — what no platform shows

- No Sharpe Ratio, annualized volatility, or max drawdown anywhere
- No investor persona matching — Very High label not actionable
- No benchmark comparison — 16.44% CAGR vs what baseline?
- No risk-return positioning — adequate return for the risk taken?

Further Steps

The Mutual Fund Risk-Adjusted Analyzer project computed exactly these missing metrics across 342 large-cap funds. ICICI Prudential Large Cap — the fund in both screenshots — passed all 4 downside protection filters. Its Very High label is misleading. Its risk-adjusted performance is better than most funds in its category. This insight is invisible on both platforms. The 76% of investors who track no metrics are not making a mistake — they are not being given the tools to do so.
